TITLE: Some aspects of the immunopathology of animals chronically exposed to radioactive zinc (Zn^{65})

SOURCE: AMN SSSR. Vestnik, no. 9, 1965, 65-70

TOPIC TAGS: zinc, immunology, radiation damage, radioisotope, antigen, pathogenesis, gamma globulin

ABSTRACT: Daily peroral administration of $Zn^{65}C_2$ (10 μ c per kg of weight) to rabbits for 18 months significantly altered the animals' antigen structure and protein fractions and brought about morphological changes in various tissues. Antibodies against homologous denatured protein clearly appeared during the 9th month. At the same time there was a marked decrease in the serum albumins while the quantity of

gamma and beta globulins increased and the albumin-globulin ratio underwent phasic changes--all suggestive of dysglobulinemia. Tissue changes in the hematopoietic organs included hyperplasia of the reticuloendothelial elements, increase in the number of foci of extramedullary hematopoiesis in the spleen, lymph nodes, and lungs, and enlargement of staff and band cells in bone marrow. Degenerative changes were noted in the liver, kidneys, thyroid, and gonads. Signs of radiation lesions appeared between the 16th and 18th months. Rabbits given smaller doses of Zn^{65} exhibited the same immunological and morphological changes as those receiving the 10 $\mu\text{C}/\text{kg}$ dose but they were less pronounced. Autoimmunological mechanisms play a major role in the pathogenesis of chronic radiation damage. Orig. art. has: 1 figure.

TITLE: A Hydraulic Motor, Model PM-400, for Driving of Honing Machines (Gidrodvigatel' mod. PM-400 dlya privoda khoningoval'nykh stankov)

PERIODICAL: Stanki I Instrument, 1958, Nr 8, pp 41-42 (USSR)

ABSTRACT: A 15-cylinder swashplate type hydraulic motor with two opposed plungers in each cylinder is described and shown in cross section. The unit has been manufactured by the "Gidroprivod" Works in Khar'kov to the design of SKB-7. The motor consumes up to 60 kW, weighs 210 kg, has a maximum speed of 950 rpm, a maximum oil consumption of 400 l/min and a maximum pressure of 100 kg/cm². Speed control is accomplished by variable oil flow to the motor, and permits reversal of rotation in operation. There is 1 illustration.

FILETAN, S.F.

Preparation of methylethylaniline. Ya. Ya. Makarov, Zemtynskii, Sh. E. Plator, and V. S. Velichkin. *J. Appl. Chem. (U.S.S.R.)* 10, 600 (1937). (a) MeSO_2 (318 g.) was added by drops to the soln. of PhNH_2 204, NaOH 252 g. and water 370 cc., while keeping the temp. always below 8° , with const. stirring. The stirring was continued for 1 hr. after all the MeSO_2 had been added, and the resulting soln. was treated with 200 cc. of 40% NaOH . PhNH_2 (I) was red. with Rt_2O (14 times) and dried over NaOH (solid). After 12 hrs., the Rt_2O was distd. off and I was fractionated. The yield of I b. $200-4^\circ$ was 190 g. (70%). (b) $\text{MeC}_2\text{H}_4\text{SO}_2\text{Me}$ (II) was added in small portions with const. stirring to the mixt. of PhNH_2 10.3 g. in a soln. of NaOH 8 g. in 12 cc. of water preheated to 80° . After the addn. of II, the mixt. was kept at 80° for 1 hr., then the resulting mixt. was treated with 20 cc. of 20% NaOH , and cooled. I was extd. with Rt_2O . The yield of I b. $200-4^\circ$ was 85.00% (theory). (c) The mixt. of PhNH_2 163, MeOH 54.8, (theory) 11.50, 7.36 g. was heated in a rotating seal autoclave for 13 $\frac{1}{2}$ hrs. at $170-180^\circ$ and finally at 210° for 2 hrs. Then, the excess of MeOH was distd. off and the mixt. of secondary and tertiary amines was steam-distd. extd. with Rt_2O and dried over solid NaOH , yielding 89.83 and PhNH_2 0.07%. H_2SO_4 can be substituted by MeI 54.4, (10 g.) and the mixt. heated gradually (10 hrs.) from 181° to 204° . In this case the yields were 89.7% and MeSO_2 0.72%, resp. (d) PhNH_2 197, MeOH 54.8 and MeSO_2 11.3 g. were treated as in (c) (theatd. for 0.5 hr. at 180° ,

for 3 hrs. at 180°, and for 3 hrs. at 210°, yielding 184.0 g. and PHNHR (0.87%). For identification of the I obtained, its picrate was prepared; it forms light yellow rhombic crystals, $m. 141-3^{\circ}$ (after several recrystallizations). Komatsu et al.¹ (1933) and Singh et al.² (1934-5, resp.) gave the $m. p.$ of this picrate as 121-2° and 134-5°, resp., but the ultimate analysis of the picrate obtained proved that the picrate of I $m. 141-3^{\circ}$. The content of I in the mixt. of amines was detected by transforming it into p-NOC(=O)NHF, $m. 67^{\circ}$, by the usual method (keeping the temp. below 1°), with a yield of 94% (theory). Twenty-eight references.

TITLE: Dark crust in the macrostructure of stainless heat resistant alloyed structural steels

SOURCE: Stal', no. 6, 1964, 540-544

TOPIC TAGS: steel, stainless steel, heat resistant steel, crust formation, steel 13Kh12NVMFA, steel 13Kh14NVFRA, steel 20Kh15N3MA, steel Kh17N2, steel 4Kh9S2, steel Kh28, steel Kh17, steel Kh25, structural steel 18KhNVA, structural steel 15KhGNTA, structural steel 18KhNT, structural steel 40KhNMA

ABSTRACT: This study is a continuation of a previous investigation on the nature of dark crusts common on stainless heat-resistant steels of the types 13Kh12NVMFA, 13Kh14NVFRA, 20Kh15N3MA, Kh17N2, Kh17, Kh25, 4Kh9S2, Kh28 and on the alloyed structural steels 18KhNVA, 15KhGNTA, 18KhNT, 40KhNMA. The investigation consisted of metallographic analysis of samples cut from "healthy" and from defective sections of ingots, and the comparison of their compositions and structures. Metal-
Card 1/2

ACCESSION NR: AP4040388

lographic study showed that defective sections were richer in carbon, aluminum, and aluminum oxides. Large silicate inclusions of complex composition with multiple aluminate inclusions were found to be distributed regularly in the direction of deformation. Corundum represented the basic part of the precipitate and occurred in the form of transparent colorless grains ($N_g = 1.767$). Spinel and titanium were less common. The precipitate also contained colored anisotropic inclusions with $N_g = 1.775$. The experiments revealed that the dark crust originated in the deadhead zone and penetrated the body of casts during the crystallization period. Defects caused by crust formation were eliminated by preventing the chipping of the crust and its subsequent sinking into the metal. This was achieved by decreasing the heat of flux by sprinkling lunkerite 28, vermiculite powder, or chamotte over the ingots (2 kg per ton of metal). Orig. art. has: 1 table, 6 figures, and 1 formulas.

TOPIC TAGS: CERIUM, oxidation resistant steel, stainless steel, chromium nickel steel, cerium containing steel, steel structure, steel property/
OKh23N18 stainless steel

ABSTRACT: Several heats of OKh23N18 stainless steel were melted in a 10-ton basic arc furnace, with ferrocerium added as the finishing period and cast into 2.7-ton ingots. It was found that the presence of cerium in the solid solution affects the diffusional processes taking place in steel during its crystallization and thus helps to reduce dendritic nonuniformity. This in turn results in a more uniform structure which makes it possible to expand the hot-working temperature range without danger of cracking. Orig. art. has: 6 figures.

Zizyukin, Mikhail Il'in

Preduprezhdeniye i analiz braka v mashinostroyeni (Prevention and Analysis of Waste in Machine Building) Moscow, Mashgiz, 1957.
221 p. 6,000 copies printed.

Reviewers: Bozhukov, B.P. and Filatov, S.R., Engineers; Ed.: Rabinovich, P.M., Docent; Ed. of Publishing House: Temkin, A.V.; Tech. Ed.: Uvarova, A.F.; Managing Ed. of literature on the economics and organization of production: Saksaganskiy, T.D.

PURPOSE: This book is intended for industrial engineers, technical personnel and economists.

COVERAGE: The book deals with the analysis of production rejects and methods of current production control. Special emphasis is placed on statistical methods of production quality control and the analysis of manufacturing processes used in Soviet and foreign plants. Various methods of production inspection and non-destructive testing, such as ultrasonic and radiographic methods,

Card 1/5

Prevention and Analysis of Waste in Machine Building 407

are discussed, and definitions of industrial terms used in quality control are given. Chapter III was written by Docent P.M. Rabinovich. There are no references.

Bentonites of Sarigukh deposit in Armenia: M. S. Merabishvili, S. S. Pilatov, and N. P. Tugushi (Inst. Mineral Deposits, Tbilisi). *Sobremennaya Akad. Nauk Gruz. S.S.R.* 15, No. 7, 431-5 (1954) (in Russian).—A detailed study of these bentonites (1) has shown that they can be used not only in drilling but also in many other fields. Suspensions of 1 are stable, have high structural and thixotropic properties and a sp. gr. of 1.03-1.05. The n_D , detd. by the immersion method, were n_D^{20} 1.504, n_D^{25} 1.490, and thermal analysis data indicate that 1 are composed mostly of clays of the montmorillonite group. By sedimentation analysis 1, in a 2% suspension, yields 8-15% of material with particle size $\geq 60 \mu$, 19-44% with particle size $= 1.5-60 \mu$, and 80-75% with particle size $\leq 1.5 \mu$. The cmt. of the latter material might be increased to 90% by using a small amt. of Na pyrophosphate peptizer. E. Barabash.

Tsitsishvili, and P.G. Shengeliya.

PURPOSE: This book is intended for economic geologists and mineralogists.

COVERAGE: This collection of articles describes the nonmetallic mineral deposits of the Georgian SSR and the extent to which they have been exploited. Individual articles discuss the importance of barite, diatomite, talc, andesite, and other minerals to the chemical industry; of barite, andesite, and bentonitic clays to the petroleum industry; and of marble, slate, and limestones to the construction industry. A map depicting the major nonmetallic mineral deposits is included with the work. No personalities are mentioned. References accompany each article.

TITLE: The D-12 Windmill (Vetrodvigatel' D-12)

PERIODICAL: Sovkhoznoye proiz-vo, 1956, Nr 9, pp 73-75

ABSTRACT: A short description of (1) "Fermer #2" windmill outfit and (2) a shaft well or a borehole with a piston-type NP-95 pump driven by the 14-hp D-12 windmill. The flour mill is driven by a belt via an automatic-clutch drum. A type "VL" winch with a type NP-95 piston pump is used for lifting water; they are supplied by the manufacturer along with the windmill. The winch also has a belt drive operating from a pulley of the lower reducing gear of the windmill. With an average annual wind velocity of 5 m/sec, the outfit can mill up to 2,000 t of fodder grain and lift up to 2,000 m³ water per year from 60 m depth. One man is needed to operate the outfit. Two schemes of the outfit are presented.

TITLE: UCS-1 unit for diffusion bonding in a vacuum

SOURCE: Svarochnoye proizvodstvo, no. 6, 1965, 34-35

TOPIC TAGS: diffusion bonding, metal diffusion bonding, vacuum diffusion bonding
 unit, UCS-1 diffusion bonding unit

ABSTRACT: The Scientific Research and Design Institute for Testing Machines and

... of parts up to 120 mm in diameter and up to 120 mm. The
 ... unit develops a maximum pressure of 5 tons on the parts being
 ... working temperature of 1200°C is obtained by air heating. The
 ... The air evacuation system ... a vacuum of 0.02 mm Hg and a diffusion
 ... bonding. The power is supplied by a ...
